April 2018

# Version 1.1.107.1

With this introductory release of Metalogix RestorePoint, the process of restoring individual or multiple SharePoint objects is easy. You can connect directly to your backup sources and navigate through them as though they were live SharePoint sites, and SharePoint objects can be recovered directly to the production environment, or to any new SharePoint server. You no longer need to rebuild your entire production database or worry about deploying a temporary SharePoint recovery farm to recover your SharePoint farm objects.

## New Features

### Selective granular restore

Provides options to restore granular objects – site collections, sites, lists, libraries, folders, items and documents, and can occur over any scope and can even be performed across SharePoint farms. Granular restore is done with full fidelity.

### Granular content search

Allows administrators to perform a text-based search to locate objects by name in mounted or linked content databases

### Merge content during restore

Provides the option to restore the differentials without overwriting any existing objects. You can choose to add only the missing objects to the destination.

### Intuitive tree-based user interface

Presents a familiar, tree-based graphical user interface like the Windows File Explorer, to restore site collections, sites, lists, libraries, folders, items and documents.

### Manage multiple farms from a single user interface

RestorePoint allows administrators to restore any number of farms from a single console.

### Self-service recovery

Allows authorized users to download specific library items directly from within SharePoint, even if it's no longer in the recycle bin. This feature saves backup administrators time and effort while also giving site collection administrators and authorized users fast, convenient access to their backed-up library items.

### Support for Metalogix StoragePoint

To significantly improve both backup and recovery times, RestorePoint will automatically integrate with Metalogix StoragePoint. You can seamlessly restore content from a remote blob storage (RBS) enabled

farm optimized with Metalogix StoragePoint. Restores can be performed even if the backup does not contain the externalized files.
